

IN THE CLAIMS:

Please amend the claims as follows:

1. (currently amended) A condom having applied to its external surface a vasodilator active compound and being coated with a lubricant, characterized in that the vasodilator active compound is disposed on the external condom surface ~~either: (1) in a form which is immiscible with the lubricant, or (2) the vasodilator active compound is disposed on the external condom surface~~ within a composition, the composition being immiscible with the lubricant.

2. (original) A condom according to claim 1, in which the vasodilator active compound is disposed towards the open end of the condom.

3. (previously presented) A condom according to claim 1 or claim 2, in which the vasodilator active compound is applied as a composition which includes a carrier material with which the vasodilator active compound is miscible but which will release the vasodilator active compound when in contact with body tissue.

4. (previously presented) A condom according to claim 1, in which the lubricant is buffered to a pH of between 3 and 5.

5. (previously presented) A condom according to claim 1, in which the condom includes a textured or undulating region to the external surface.

6. (previously presented) A condom according to claim 5, in which the textured or undulating region extends at least towards the open end of the condom and incorporates or includes the vasodilator active compound.

7. (original) A condom according to claim 6, in which the textured or undulating region is formed from one or more layers of material including the material from which the condom itself is formed, the material of at least one such layer being miscible with the vasodilator and allowing the vasodilator to be absorbed by skin or tissue when brought in contact with the condom.

8. (previously presented) A condom according to claim 1, in which the vasodilator active compound is selected from nitrates, long and short acting alpha-adrenoceptro blockers, ergot alkaloids, anti-hypertensives, the prostaglandis and phosphodiesterase inhibitors optionally in combination with a skin penetration enhancer.

9. (previously presented) A condom according to claim 8, in which the vasodilator active compound comprises an organic nitrate applied in a polar elastomer in solution, in the form of an aqueous dispersion of latex or by a hot melt or reactive process.

10. (previously presented) A condom according to claim 1, in which the active

compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

11. (previously presented) A condom according to claim 2, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

12. (previously presented) A condom according to claim 3, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

13. (previously presented) A condom according to claim 4, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

14. (previously presented) A condom according to claim 5, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

15. (previously presented) A condom according to claim 6, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

16. (previously presented) A condom according to claim 7, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

17. (previously presented) A condom according to claim 8, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

18. (currently amended) A condom according to claim [[9]] 1, in which the active compound optionally together with a skin penetration enhancer is applied to the condom as a composition dispersed or dissolved in a gel carrier comprising a liquid medium and a thickening agent.

19. (new) A condom comprising:

a lubricant coated onto the condom, and

a vasodilator active compound applied to an external surface of the condom, the vasodilator active compound being immiscible in the lubricant so that the vasodilator active compound is constrained from migrating to areas of the condom other than where the vasodilator active compound is applied.
